the award of the internship of*

DATA VISUALIZATION IN INFOSYS SPRINGBOARD

Submitted by

Nimisha Vilas Rajendra

Guided by

Prof.VAMSI

ACKNOWLEDGEMENT

I would like to express my heartfelt appreciation to Infosys Springboard for granting me the opportunity to participate in this internship and delve into the exciting field of financial forecasting through Power BI Desktop.

I am deeply thankful to my mentor for their exceptional guidance, continuous support, and insightful advice throughout this project. Their expert feedback and direction have significantly influenced the quality and scope of this work.

I would also like to extend my thanks to the entire Infosys Springboard team for crafting an internship program that encourages hands-on learning and the practical application of knowledge. This experience has allowed me to enhance my technical skills and deepen my understanding of data analysis, which will prove valuable in my career journey.

Finally, I am immensely grateful to my family, friends, and peers for their constant encouragement and motivation. Their belief in me has been a great source of inspiration.

This report is the result of collective efforts, and I am thankful to all those who have contributed to its successful realization.

ABSTRACT

Financial forecasting plays a pivotal role in business decision-making, enabling organizations to predict future financial performance, optimize resource distribution, and support strategic planning. This project aims to create an interactive financial forecasting dashboard using Power BI, a versatile data visualization tool. The primary objective was to convert historical financial data into valuable insights through dynamic visual representations, empowering decision-makers to make informed, data-driven choices.

The project entailed the gathering and preprocessing of financial data, the application of forecasting techniques like moving averages and exponential smoothing, and the utilization of DAX (Data Analysis Expressions) for real-time data analysis. The dashboard features an intuitive interface for stakeholders to examine financial trends, forecast future outcomes, and evaluate crucial financial indicators such as revenue, expenditures, and profit margins.

By incorporating advanced forecasting models into Power BI, this project highlights the effectiveness of data visualization tools in enhancing business intelligence, optimizing financial forecasting, and aiding strategic decision-making. The report outlines the methodologies used, challenges faced, and results achieved, providing a thorough overview of how modern business intelligence platforms can streamline financial forecasting.

OVERVIEW OF THE PROJECT

The project focuses on the creation of a financial forecasting dashboard using Power BI, a leading data visualization tool. The dashboard aims to enhance financial decision-making by providing dynamic visualizations of historical financial data. By using advanced forecasting techniques such as moving averages and exponential smoothing, the project transforms raw financial data into actionable insights, empowering organizations to predict future financial performance and optimize resource allocation. The dashboard is designed to present key financial metrics, including revenue, expenses, and profit margins, offering stakeholders an interactive platform to explore trends and forecasts.

SCOPE OF THE PROJECT

The scope of this project encompasses the development of an interactive financial forecasting dashboard using Power BI, from data collection and preprocessing to the final visualization and reporting. The project covers the entire data analysis lifecycle, including:

- Collecting and preprocessing financial data.
- Implementing forecasting models to predict future financial outcomes.
- Using Power BI's capabilities for data transformation, modeling, and visualization.
- Creating a user-friendly dashboard that allows stakeholders to interact with the data, explore trends, and make informed decisions.
- Leveraging DAX for real-time calculations and advanced data analysis.

The scope extends to integrating Power BI with existing business processes to provide insights that support strategic decision-making.

OBJECTIVE

The primary objective of the project is to develop an interactive financial forecasting dashboard using Power BI to facilitate data-driven financial planning. The specific objectives are:

- To transform historical financial data into meaningful insights using dynamic visualizations.
- To implement advanced forecasting techniques for predicting future financial outcomes.
- To design an intuitive and interactive dashboard that allows users to analyze financial trends and make informed decisions.
- To improve financial planning by providing stakeholders with real-time updates and performance analysis of key metrics such as revenue, expenses, and profit margins.

METHODOLOGY

The methodology of this project involves a systematic approach to data collection, processing, analysis, and visualization:

1. **Data Collection:** Financial data from relevant sources is collected and imported into Power BI from Excel, CSV, or online databases.
2. **Data Preprocessing:** The raw data is cleaned and transformed using Power Query to ensure consistency and relevance. This includes removing duplicates, handling missing values, and standardizing formats.
3. **Data Modeling:** Relationships between different data tables are defined, and DAX (Data Analysis Expressions) is used to create calculated columns and measures.
4. **Forecasting Techniques:** The project applies forecasting techniques such as moving averages and exponential smoothing to predict future financial performance.
5. **Dashboard Design:** An interactive Power BI dashboard is developed to display the financial data and forecasts, incorporating visualizations like bar charts, line graphs, and tables.
6. **Interactivity:** Filters, slicers, and cross-filtering options are added to enable users to interact with the data and focus on specific insights.
7. **Publishing and Sharing:** Once the dashboard is complete, it is published to the Power BI service for online sharing, collaboration, and real-time updates.

INTRODUCTION TO POWER BI

Power BI Definition

Power BI is a tool created by Microsoft that helps you turn raw data into meaningful visuals like charts, graphs, and dashboards. It allows you to easily analyze and understand your data, share reports with others, and make informed decisions based on the insights you get. It's like a smart assistant for your data that helps you see patterns, trends, and key information in an easy-to-understand way.

Features of Power BI

1. **Interactive Dashboards:** Create visually appealing dashboards with real-time updates.
2. **Data Connectivity:** Connect to a wide range of data sources (databases, cloud services, etc.).
3. **Custom Visualizations:** Use built-in visuals or create custom ones for unique needs.
4. **AI Insights:** Leverage artificial intelligence for data analysis and insights.
5. **Mobile Access:** View and interact with reports on mobile devices.
6. **Collaboration:** Share dashboards and reports with others for collaborative decision-making.

Components of Power BI

1. Power Query

- A data transformation and preparation tool that allows users to clean, shape, and combine data from various sources.
- Example: Removing duplicates, merging datasets, or transforming columns.

2. Power Pivot

- A data modeling tool used for creating relationships between tables, performing calculations, and building data models using DAX (Data Analysis Expressions).
- Example: Summing sales revenue or calculating profit margin.

3. Power View

- A visualization tool for creating interactive charts, graphs, and maps to present data in an engaging way.
- Example: Creating sales trend line graphs or customer demographic pie charts.

4. Power BI Service

- A cloud-based platform for sharing, collaborating, and publishing Power BI reports and dashboards.
- Example: Hosting reports for team access and setting up scheduled data refresh.

STEPS IN POWER BI

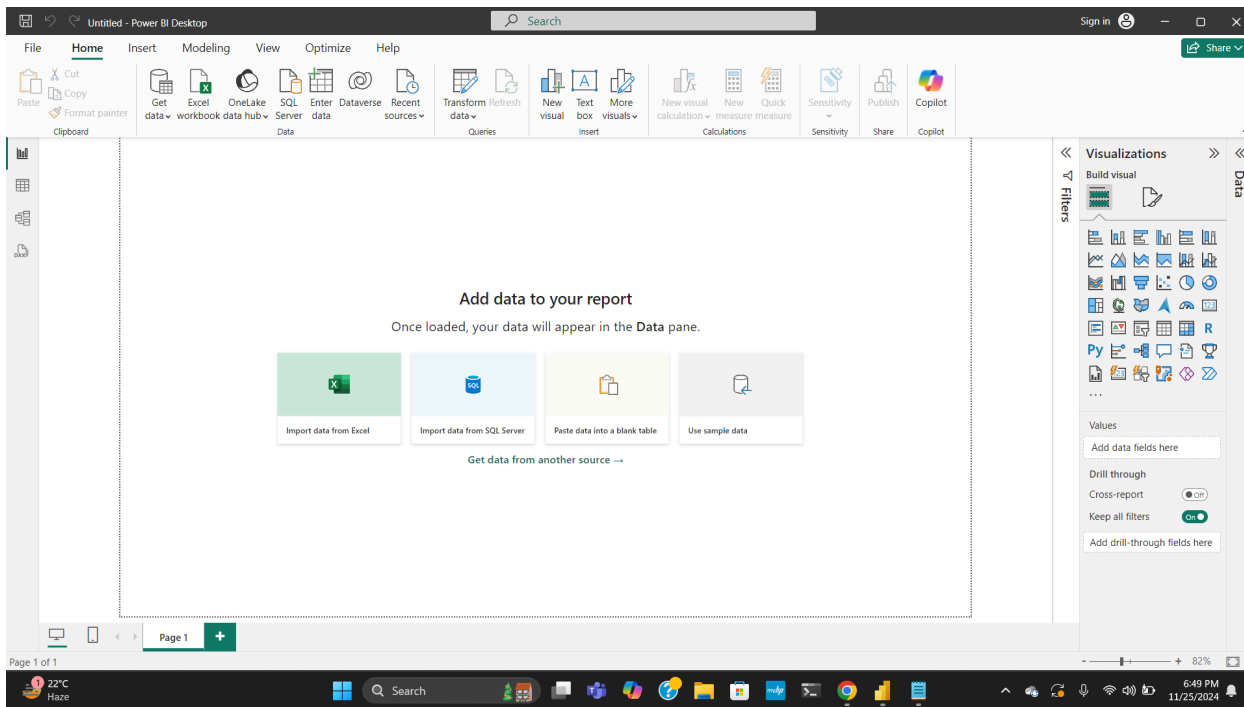

Step 1: Loading Data

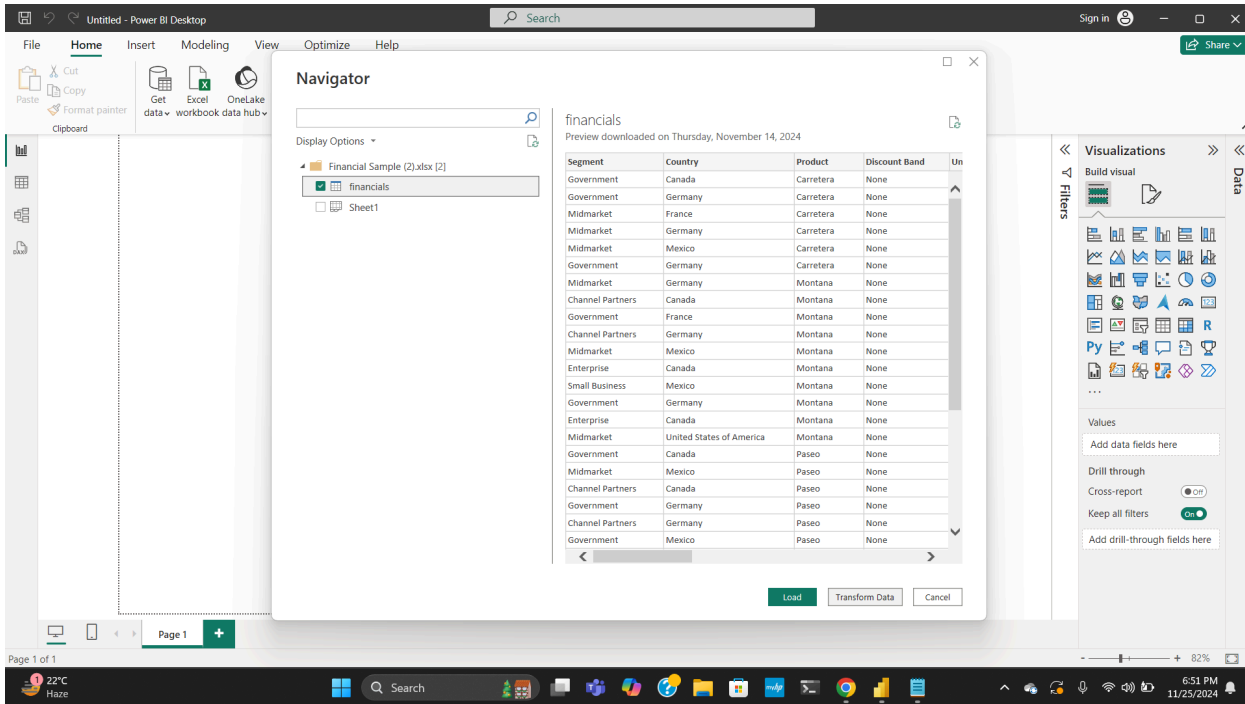

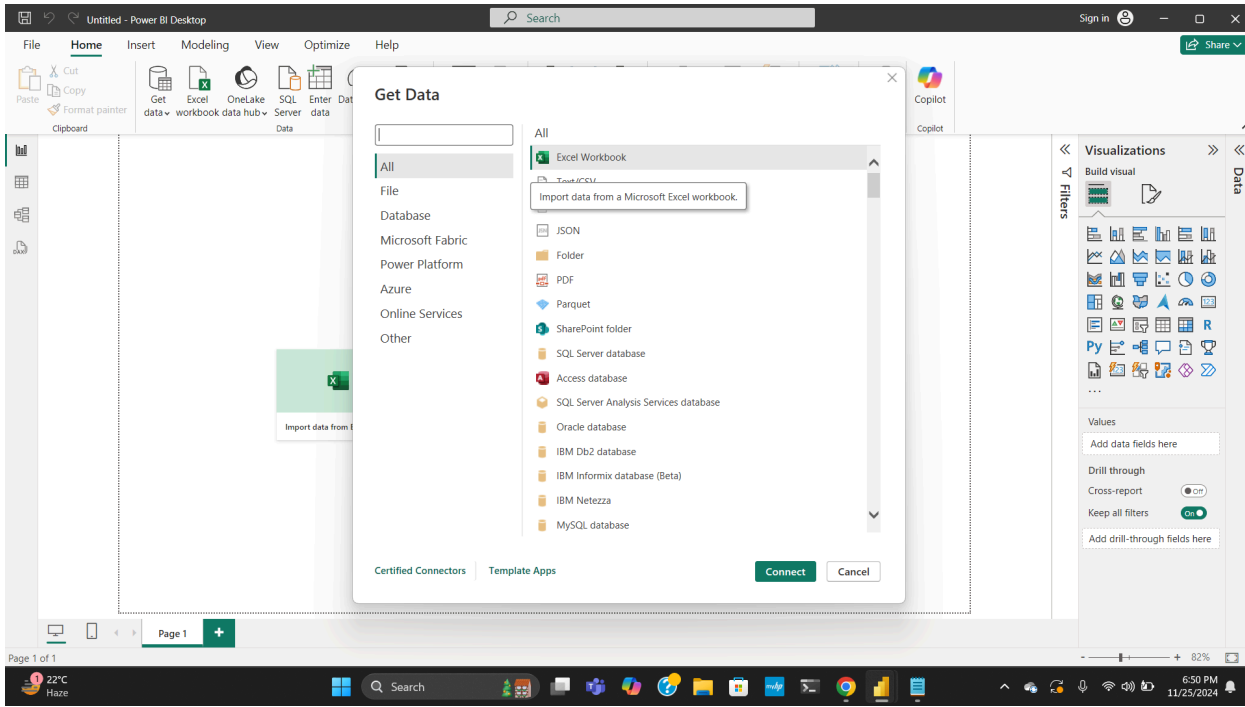

Description:

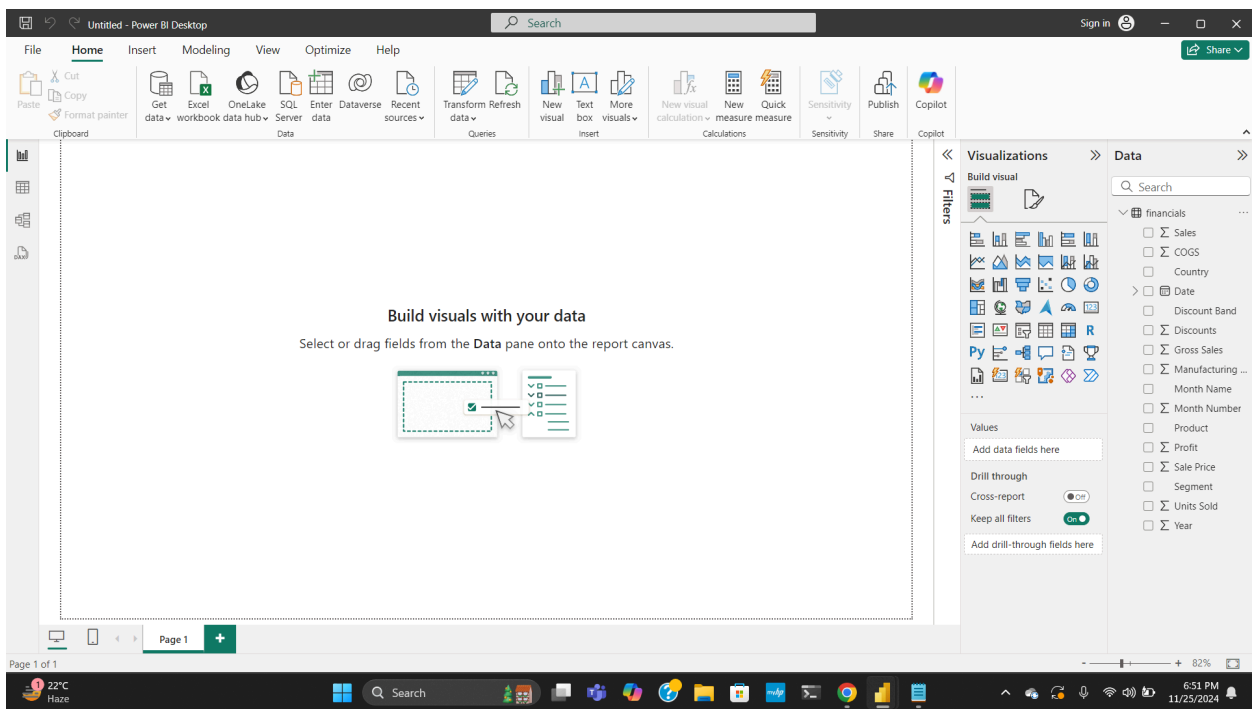

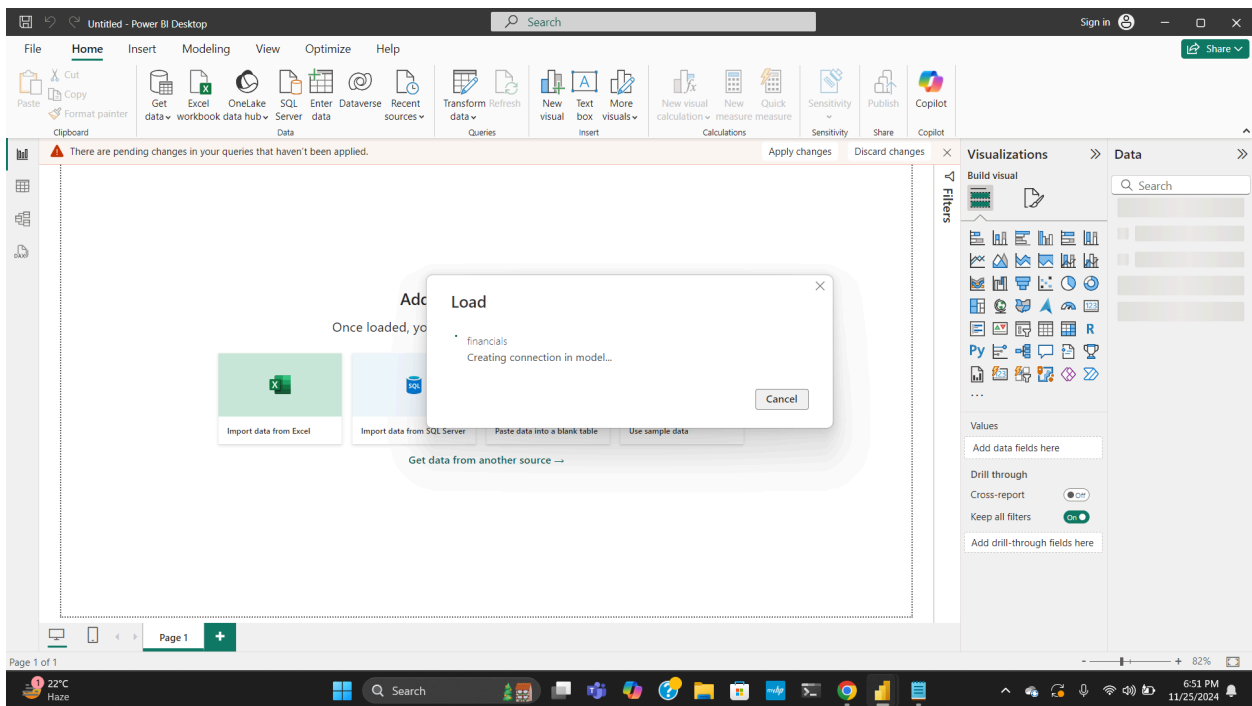

- The first step in Power BI involves importing data from various sources such as Excel, CSV, SQL Server, or online services.
- Power BI allows you to preview the data and select specific tables or fields before loading.
- After loading, data is stored in Power BI for further processing and analysis.

Key Features:

- Connect to multiple data sources.
- Combine data from different files or databases.

Step 2: Transforming Data (Power Query)

Description:

- Transformation is performed in Power Query, where raw data is cleaned and prepared for analysis.
- You can modify, filter, and shape your data to ensure consistency and relevance.
- Common tasks include renaming columns, removing null values, and changing data types.

Key Features:

- Filter rows based on conditions.
- Merge and append queries to combine datasets.
- Add calculated columns or split data into new columns.

The screenshot displays the Microsoft Power Query Editor interface. The main area shows a data table with the following columns: Segment, Country, Product, Discount Band, Units Sold, Manufacturing Price, and Sale Price. The data is organized into rows, with the first row being a header. The table is filtered to show 13 columns and 700 rows. The right-hand pane shows the 'Query Settings' for the 'financials' query, including the 'APPLIED STEPS' list which contains: Source, Navigation, Changed Type, Removed Columns, Changed Type1, Removed Errors, Removed Blank Rows, Removed Duplicates, and Replaced Value. The bottom status bar indicates '13 COLUMNS, 700 ROWS' and 'Column profiling based on top 1000 rows'. The system tray at the bottom shows the date and time as '6:53 PM 11/25/2024'.

| Segment | Country | Product | Discount Band | Units Sold | Manufacturing Price | Sale Price |
|------------------|--------------------------|-----------|---------------|------------|---------------------|------------|
| Government | Canada | Carretera | No Discount | 1618.5 | 3 | |
| Government | Germany | Carretera | No Discount | 1321 | 3 | |
| Midmarket | France | Carretera | No Discount | 2178 | 3 | |
| Midmarket | Germany | Carretera | No Discount | 888 | 3 | |
| Midmarket | Mexico | Carretera | No Discount | 2470 | 3 | |
| Government | Germany | Carretera | No Discount | 1513 | 3 | |
| Midmarket | Germany | Montana | No Discount | 921 | 5 | |
| Channel Partners | Canada | Montana | No Discount | 2518 | 5 | |
| Government | France | Montana | No Discount | 1899 | 5 | |
| Channel Partners | Germany | Montana | No Discount | 1545 | 5 | |
| Midmarket | Mexico | Montana | No Discount | 2470 | 5 | |
| Enterprise | Canada | Montana | No Discount | 2665.5 | 5 | |
| Small Business | Mexico | Montana | No Discount | 958 | 5 | |
| Government | Germany | Montana | No Discount | 2146 | 5 | |
| Enterprise | Canada | Montana | No Discount | 345 | 5 | |
| Midmarket | United States of America | Montana | No Discount | 615 | 5 | |
| Government | Canada | Paseo | No Discount | 292 | 10 | |
| Midmarket | Mexico | Paseo | No Discount | 974 | 10 | |
| Channel Partners | Canada | Paseo | No Discount | 2518 | 10 | |
| Government | Germany | Paseo | No Discount | 1006 | 10 | |
| Channel Partners | Germany | Paseo | No Discount | 367 | 10 | |
| Government | Mexico | Paseo | No Discount | 883 | 10 | |
| Midmarket | France | Paseo | No Discount | 549 | 10 | |
| Small Business | Mexico | Paseo | No Discount | 788 | 10 | |
| Midmarket | Mexico | Paseo | No Discount | 2472 | 10 | |
| Government | United States of America | Paseo | No Discount | 1143 | 10 | |
| Government | Canada | Paseo | No Discount | 1725 | 10 | |

Step 3: Data Preprocessing

Description:

- Preprocessing ensures the data is clean, standardized, and ready for use.
- It addresses missing values, duplicates, and inconsistencies to improve the quality of insights.

Key Features:

- Remove duplicates to avoid errors in analysis.
- Handle missing data by filling, replacing, or removing nulls.
- Standardize formats for consistency, such as date formats and numeric precision.

Step 4: Data Modeling

Description:

- Data modeling involves creating relationships between tables, defining measures, and building hierarchies.
- Proper modeling ensures efficient data analysis and seamless visualizations.
- Relationships define how data in different tables interacts.

Key Features:

- One-to-one, one-to-many, or many-to-many relationships.
- DAX (Data Analysis Expressions) for calculated columns and measures.
- Define hierarchies for drill-down functionality.

Step 5: Visualization

Description:

- Power BI provides an interactive canvas for creating visuals, charts, and dashboards.
- Users can choose from a variety of visualizations like bar charts, line graphs, tables, and maps to represent their data.
- Visuals can be customized to enhance clarity and user engagement.

Key Features:

- Drag-and-drop functionality for creating visuals.
- Interactivity using slicers and filters.
- Customization of colors, labels, and layouts.

Step 6: Adding Filters and Slicers

Description:

- Filters and slicers enable users to narrow down data and focus on specific insights dynamically.
- They improve report interactivity and allow deeper exploration of data.

Key Features:

- Report-level, page-level, or visual-level filters.
- Slicers for date ranges, categories, or specific fields.
- Cross-filtering between visuals.

Step 7: Publishing and Sharing

Description:

- Once the report is complete, it can be published to the Power BI Service for sharing and collaboration.
- Published reports are accessible online and can be embedded in apps or websites.
- Sharing ensures stakeholders can interact with the dashboards.

Key Features:

- Publish reports to the Power BI Service.
- Schedule data refresh for up-to-date insights.
- Export dashboards to other formats like PDF or PowerPoint.

CONCLUSION

The project successfully demonstrates the capabilities of Power BI in the development of an interactive financial forecasting dashboard, which is a powerful tool for improving data-driven decision-making in financial planning. By transforming raw financial data into insightful visualizations, the dashboard enables stakeholders to analyze trends, predict future financial performance, and optimize resource allocation.

Through the application of advanced forecasting techniques such as moving averages and exponential smoothing, the project effectively predicts key financial outcomes, including revenue, expenses, and profit margins. The integration of Power BI's features, such as DAX for real-time calculations and dynamic data interactivity, allows users to explore data, perform in-depth analysis, and make informed decisions based on up-to-date insights.

Furthermore, the project not only highlights Power BI's strengths in data loading, transformation, modeling, and visualization, but also showcases how interactive dashboards can streamline complex financial forecasting processes. By offering an intuitive user interface, the dashboard enables users to engage with data at a deeper level, enhancing their ability to make strategic financial decisions.

In conclusion, this project demonstrates how modern business intelligence platforms like Power BI can greatly enhance financial forecasting, optimize decision-making, and ultimately support better financial planning for organizations. The skills and methodologies applied in this project are valuable not only for business analytics but also for future projects that involve the integration of data science and visualization in diverse industries.
